

3D Food printing

Creating shapes and textures

March 2015

Daniel van der Linden

3D printing (Rapid Manufacturing)

3D printing allows the layer-wise building of a structure directly from a 3D computer drawing using computer-controlled additive fabrication techniques without human intervention.

3D printing is a collective term for a large number of different technologies, each based on different principles and materials.

Why print food?

Personalized food & well being

ingredients, composition,
flavors, shapes, size

health/medical, lifestyle, (dis)likes

Design freedom & new foods

innovative shapes, textures,
flavors, etc.

new product concepts, **fun!**

Alternative ingredients

proteins from algae, grass,
lupine seeds, beet leaf, insects

create tasty, structured foods

Flexible, decentralized production

freshly prepared food
where you want it

local, efficient production

Convenience

freshly prepared food
when you want it

“personal chef + microwave”

Social experience

social media supported recipes
and cooking

“pre and post fun”, communities

Where print food?

Large food companies (centralized)

food concept development
mass production printed food
personalized / on demand

Food service industry (centralized or local)

catering / restaurants
sport & health centers
(personalized: design, comp.)

Retailers (centralized or local)

supermarkets, etc.
printing for consumers

Small food companies (local)

patisseries / bakers
chocolate copy shop
(design)

Home (local)

personalized food
(design, composition)

Food printers – on sale (soon?)

Parties active in 3D food printing

Technologies – FDM

Early food products printed @ TNO

Technologies – PBP

Technologies – SLS

THE ESSENTIAL DIGITAL COOKBOOK **SECTION 6 – SAVOURY SNACKS**

SPICE BYTES

Early food products printed @ TNO

Materials types for food printing

- › **FDM:** Purees, gels, molten materials, doughs
- › **PBP:** Powders + “Liquids” / molten materials
- › **SLS:** Powders

Wide range of materials are theoretically suitable.

...BUT, not all materials and formulations are directly suitable.

Materials, processes, and equipment must be matched, tuned, and/or adapted:

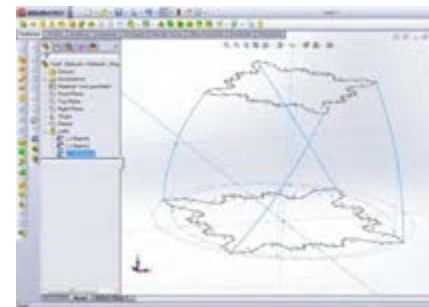

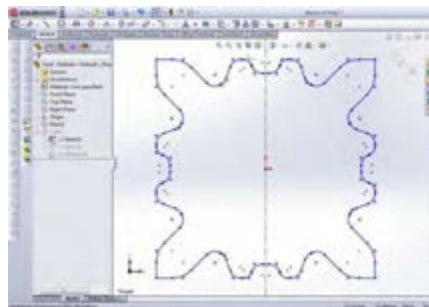

- › **Material and recipe adaptation/reformulation**
- › **Process parameter tuning**
- › **Equipment modification**

How to 3D print food

From idea to 3D printed shap

material and
process parameters

New food products: not straightforward

material and
process parameters

Formulation + process optimization

Formulation 1

Formulation 2

Formulation ##

Optimized formulation

Settings

- › Line distance = 0.1 mm
- › Writing speed = 1250 mm/sec
- › Laser power = 50 %
- › Layers = 50
- › Shape = Hollow cube 15x15x15 mm
- › Layer thickness = 0.3 mm

Food printing at TNO

Pasta printing project

Founded in 1877, Barilla is now the world's leading pasta maker.
Barilla produces pasta in over 120 shapes and sizes.
Barilla products are sold in over 100 countries worldwide.

3D printing of pasta

Various printed pasta shapes

Michelin star chocolate dessert

“Fabergé egg”

truffle

3D scan

printer file

3D printed (plastic)

3D printed (food)

“Autumn”

“Masterpiece”

Beyond shape...

Food printing of textures

Personalized food printing

“Yesterday”

leg of chicken mash

“Today”

hand-made, shaped
leg of chicken
(non-personalized)

“Tomorrow”

PERFORMANCE meals
personalised & shaped meals,
industrially manufactured

Personalized food parameters

For any given food item (e.g. a piece of broccoli) the following parameters can be personalized:

Composition

- › total # calories
- › added macronutrients: protein, fat
- › added micronutrients: minerals, vitamins, PUFAs

Other

- › size
- › hardness

3D printed personalized food

3D printed personalized food

Personalization parameters

- › composition & caloric content
*added macro- (fat, protein) and
micronutrients (vitamins, minerals)*
- › shape & size
- › hardness

Multi-texture 3D cake-type product

shape after baking

The big issues

Fully personalized food

How to develop printers that can produce fully personalized food products
("Star Trek Food Replicator")

Print faster & high res

How to fundamentally print faster and in higher resolution with various technology-food ingredient combinations

Create food textures

Go beyond the printing of shapes to the printing of food textures – both existing and new, designed textures

New value chains

Define the altered or new food value chains, products and services that will emerge

Food printing development

timeline

2014

shaping

personalized recipes

creating textures

full personalization

The future tastes good
